FEATURES/OPERATIONS

Back up camera

The back up camera assists the driver by displaying an image of the camera’s view behind the vehicle when in reverse.

To see the camera’s image of the view behind the vehicle on the monitor screen, the vehicle ignition switch must be in the ON position and the gear selector must be in the REVERSE position.

If you shift the vehicle out of the “R” position, the screen returns to the previous image.

The back up camera is a device intended to supplement the driver when motoring in reverse and should not be relied upon solely. Drivers should check behind the vehicle before entering and are reminded to use the rear view and side mirrors once seated to ensure the intended path is clear before moving the vehicle.

NOTICE

If the vehicle is hit, the position and mounting angle of the camera may change. Be sure to have the camera position and mounting angle checked at your local Toyota dealer.

The camera is of water proof construction. Do not detach, disassemble or modify it. Any of these activities may cause the system to malfunction.

If the temperature changes rapidly, such as pouring hot water on the vehicle in cold temperatures, the system may not operate normally.

Do not hit the camera or expose it to strong impact as this may cause its position and mounting angle to change.

Do not rub the camera lens strongly. If the lens is scratched it cannot transmit a clear image.

Do not allow organic solvent, car wax, window cleaner or glass coat to adhere to the camera. If contact is made with one of these substances wipe it off as soon as possible.

When replacing tires on the vehicle, please consult your Toyota dealer. If you replace the tires, the area displayed on the screen may change.

Do not use a high-pressure car-wash machine type wand to spray the camera or camera area as this may cause serious damage to the rear view camera. Using intensive bursts of water may result in the camera malfunctioning.
The image on the screen is an approximation only.

The area displayed on the screen may vary according to vehicle orientation or road conditions.

The area detected by the camera is limited. The camera does not detect objects which are close to either corner of the bumper or under the bumper.

If a bright light (for example, sunlight reflected off the vehicle body) is picked up by the camera, a Smear effect* may occur.

*Smear effect
A phenomenon that occurs when a bright light (for example, sunlight reflected off the vehicle body) is picked up by the camera; when transmitted by the camera, the light source appears to have a vertical streak above and below it.
